                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the human zacrp3 protein (AAB29580) and to CC nucleic acids which encode it (AAC64058, AAC64063). Zacrp3 is a homogue cc of adipocyte complement related protein (ACRP30) and contains a CC collagen-ilke domain comprising Gly-xaa-Xaa or Gly-xaa-Pro repeats, and a CC cterminal Clq domain comprising 10 beta-strands. The zacrp3 gene is CC located on chromosome 5p12. The invention also relates to zacrp3 gene is CC located on chromosome containing zacrp3 polypeptides, calls cc zacrp3-specific antibodies, expression constructs and host cells CC comprising zacrp3 nucleic acids, and methods of recombinant production of CC zacrp3. Human zacrp3, and its agonists and antagonists may be used in the CC zacrp3. Human zacrp3, and its agonists and antagonists may be used in the CC anorexia, and conditions associated with these disorders such as obesity and CC anorexia, and conditions associated with these disorders may be useful CC like domain, zacrp3 and zacrp3-containing fusion proteins may be useful CC as antimicrobial agents, promoting lysis or phagocytosis of infectious CC organisms such as bacteria or viruses. Zacrp3, its fragments, fusion CC contains, antibodies and activity modulators may also be used to inhibit collagen. Induced platelet aggregation, adhesion, or activation, and may therefore be treat injury to the vasculature or other collagence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of a mammal e.g., to treat injury to the vasculature or other collagenous tissue. Human zacrp3 and its antibodies may additionally be used to study dimerisation and oligomerisation. The present sequence represents cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NO . .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
This invention relates to nucleic acid sequences AAF93744 - AAF93916

CW which encode human secretory or membrane proteins represented by

CR AAB88317 - AAB88419. Included in the invention are primers

CR CAAF93917 - AAF94295 and AAF62232 - AAF62235 which are used to isolate the

CR COMA sequences of the invention. The invention also includes methods for

CR the production of antibodies directed against the proteins, and cDNA

CR sequences, which can be used in vaccines. The polynucleotide sequences

CR can be used in gene therapy. The polynucleotide sequences and the

CR proteins they encode may be used in the prevention, treatment and

CR diagnosis of diseases associated with inappropriate secretory

CR protein/membrane protein expression. The nucleic acids and complementary

CR sequences may also be used as DNA probes in diagnostic assays

CR (e.g. polymerase chain reactions (PCR)) to detect and quantitate the

CR presence of similar nucleic acid sequences in samples. They may also be

CR used to study the expression and function of secretory proteins/membrane

CR polymeptides and their role in metabolism. The polypetides may be used

CR as antigens in the production of antibodies against them and in assays to

CR cl diagnosis to down regulate expression and activity. The antibodies may also be

CR agents to down regulate expression and activity. The antibodies may also

The present sequence encodes a secreted or transmembrane polypeptide. The specification describes polypeptides designated PRO1484, PRO4334, PRO1122, PRO1889, PRO1889, PRO1887, PRO1785, PRO4355, PRO4357, PRO4356, PRO4560, PRO4560, PRO4560, PRO4560, PRO4560, PRO5990, PRO6030, PRO4424, PRO4422, PRO4430 and PRO4499, PRO1889 polypeptide is useful for diagnosing tumour in a mammal. The polypeptides, their agonists and antagonists are useful treating a condition associated with expression or activity of the polypeptide. Conditions treated include obesity, diabetes or hyper-or hypo-insulinemia. The polypeptides are capable of inducing proliferation of mammalian kidney mesangial cells and are therefore useful for treating kidney disorders associated with decreased mesangial cell function such as Bergers disease or other nephropathies associated with Schonlein-Henoch purpura, celiac disease,
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel secreted and transmembrane polypeptides useful for diagnosing tumour in a mammal, for identifying agonists and antagonists of the polypeptide and for therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sig_peptide

This sequence represents the cDNA for a human immune system molecule (C [IMOL] isolated as clone 1890540 from the Incyte BLAD70707 library. CC [Thoch human IMOLS (AAB15536-B1550)] and their encoding polynucleotides (AAA95775-A95789), and compositions comprising them are useful for the diagnosis, treatment or prevention of immunological disorders. The IMOL can be used to treat or prevent disorders associated with decreased (C e.g. inflammation, actinic keratosis, AIDS, Addison's disease), (C family for the development of antibodies that concers (e.g. actinic keratosis, arteriosclerosis, bursitis), and (C cancers (e.g. actinic keratosis, arteriosclerosis, bursitis), and (C cancers (e.g. leukemia, melanoma, sarcoma). The peptides are also (C specifically recognizes these peptides. The polynucleotides may be used for the development of antibodies that (C expression of IMOL may be correlated with the disease, as targets in a microarray, to detect differences in gene sequences among normal, (C carrier and affected individuals, and for screening libraries of (C compounds in drug screening techniques. Antibodies which specifically be used for the disagnosis of disorders characterized (C bind to IMOL may be used for the disagnosis of disorders characterized (C with IMOL or agonists, antagonists, or inhibitors of IMOL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti-inflammatory; keratolytic; anti-HIV; anti-allergic; antianaemic; antiarteriosclerotic; antiasthmatic; antiabetic; nephrotropic; cance; antigout; dermatological; antihyroid; runcide; hepatotropic; antibod; immunosuppressive; cytostatic; fungicide; protozoacide; antibacterial; gene therapy; diagnostic; immunological disorder; viral infection; ss; bacterial infection; fungal infection; parasitic infection; immunogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human immune system molecules 1-15 and polynucleotides encoding them useful for diagnosing, treating or preventing e.g. immunological disorders, infections, cell proliferative disorders, microbial

The sequences of the invention are useful for treating, preventing and ameliorating various diseases such as inflammatory disorders (e.g. disorders, skeletal developmental disorders, growth abnormalities, neurodegenerative disorders (e.g. Huntington's disease), nervous system disorders, autoimmune disorders (e.g. rheumatoid arthritis), periopathies, viral and bacterial infections, alpha-mannosidosis, diabetes, cancers, malignant tumours, hyper- and hypotension, obesity, bulimia, anorexia, analignant tumours, hyper- and consensation, obesity, bulimia, anorexia, schizophrenia, growth, mental cor sexual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. ABK35609 represent the genes encoding the novel human secreted or membrane-associated proteins of the invention.

cancer and ted polynucleotide used in the identification and encoding polypeptides used for treating i neurological diseases inflammatory of genetic

Claim 1; Page 317-318; 352pp; English.

The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and trabel inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.

                                                                                                            defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a cDNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprising zacrp3 nucleic acids, and methods of recombinant production of carpas. Human zacrp3, and its agonists and antagonists may be used in the study and modulation of cellular metabolism and energy balance in mammals, and may therefore be used to treat disorders such as obesity and anorexia, and conditions associated with these disorders. Due to its Clq like domain, zacrp3 and zacrp3-containing fusion proteins may be useful as antimicrobial agents, promoting lysis or phagocytosis of infectious organisms such as bacteria or viruses. Zacrp3, its fragments, fusion proteins, antibodies and activity modulators may also be used to inhibit collagen-induced platelet aggregation, adhesion, or activation, and may therefore have potential for promoting blood flow within the vasculature of a mammal e.g., to treat injury to the vasculature or other collagenous clisue. Human zacrp3 and its antibodies may additionally be used to study cdimerisation and oligomerisation. The present sequence represents DNA or consideration of the present sequence represents DNA or consideration and oligomerisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of adipocyte complement related protein (ACR930) and contains a collagen-like domain comprising Gly-Xaa-Xaa or Gly-Xaa-Pro repeats, and C-terminal Clq domain comprising 10 beta-strands. The zacrp3 gene is located on chromosome 5p12. The invention also relates to zacrp3 fragments, fusion proteins containing zacrp3 polypeptides, zacrp3-specific antibodies, expression constructs and host cells comprising zacrp3 replaced and morlein acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel zacrp3 polypeptides used to treat or prevent bacterial or viral infections, for wound healing, improving blood flow, and to analyze energy efficiency in mammals - \,

The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HTV-1 to leukocytes. The invention may also be used to treat growth and developmental effects, skin wounds and hair follicle disorders. Sequences AZS61506-Z61832 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences derived AZS6166-Z61649, AZS61725-Z61765, AZS61802-Z61811 and AZZ61826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences AZS61650-Z61668, AZS61766-Z61780, AZS61812-Z61817 and AZS61827-Z61829 encode proteins with one or more putative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1123 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates dermal papilla, human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                          dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Az561006-z61802 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences Az56106-z61649, Az561725-z61765, Az561802-z61811 and Az561826 encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Skin; dermal papilla; keratinocyte; neonatal foreskin fibroblast; embryonic skin cell; keratinocyte stem cell; transit amplifying cell secreted; transmembrane; inflammation; cancer; neurological disease; angiogenesis; tumour vascularisation; growth disorder; developmental disorder; skin wound; hair follicle disorder;
                                                                                  proteins with an N-terminal signal sequence, indicating that the are secreted. Sequences AAZ61650-Z61668, AAZ61766-Z61780, AAZ618 and AAZ61827-Z61829 encode proteins with one or more putative

mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immundeficiency virus (HIV)-1 to leukocytes, and treating inflammmatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns
                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide used in the identification disorders and encoding polypeptides used for treating

                                                                                                                                                                                                                                                                              New isolated polynucleotide used in the identification disorders and encoding polypeptides used for treating disease, cancer and neurological diseases -
                                                                         The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of
tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukcytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in

                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a cDNA of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
